Continuation of 11. does NOT place the application in condition for allowance because: The amendments to Figs 1 and 3 and [0020] overcome the drawing and specification objections. As a result of the amendment, Fig 1 now shows "First interface 22". However, this label was previously deleted in the amendments to the drawings filed on 19 September 2008. Therefore, it appears that this was inadvertently brought back from the original drawings and should be deleted. On the other hand, if the amendment was intentional, then the drawings are objected to as failing to comply with 37 CFR 1.84(p)(5) because they include the following reference character not mentioned in the description: First interface 22.

The 35 U.S.C. 112 claim rejections have been maintained, because Applicant did not address these rejections.

Applicant's arguments with respect to Fukuda have been fully considered and are persuasive. The rejection of Fukuda has been withdrawn.

Applicant's arguments with respect to Lu have been fully considered but they are not persuasive. Applicant asserts, "The Office Action admits that Lu does not teach a saturable absorber and the description of the contrast enhancing layer does not necessarily suggest that it operates such the light absorption decreases with increasing light intensity" (P4L24-27). The examiner respectfully disagrees. This argument has already been addressed in the previous Office action, and the following is a restatement of the response on P9L10-18.

Fig 5 of Lu shows a graph of transmission vs. dose of the contrast enhancing layer. When dose, which is equivalent to light intensity, is increased, the transmission increases as well. Moreover, transmission and absorption are inversely proportional, because as more light is transmitted, less light is absorbed. As a result, the contrast enhancing layer exhibits decreasing light absorption with increasing light intensity. Consequently, the contrast enhancing layer has the same properties as the saturable absorber of claim 1 and can be used as such. Therefore, Lu discloses that the contrast enhancing layer is a saturable absorber.
